

**Basket Bowl Ball Rack*

dimensions variable

unique

The work consists of: a basketball, a bowling ball, a rack, a motor. The basketball can be any regulation NBA-sized ball. The bowling ball can be any bowling ball you find in your local community. *The rack is specifically the rack pictured above. Basketball and bowling ball should be placed stacking on each other. The basketball is always on the top of the rack and the bowling ball is always on the bottom of the rack. The motor is turned on to imagine machine noise, alike the machine noise a conveyor belt creates while returning a bowling ball to a bowler. Place the motor somewhere inconspicuous, but still heard. The work has no recommended duration, and can be placed on any flatish surface, preferably a flatish surface that is indoors.

Thanks,

Michael Seh
